Race Targets

**Half Oceanman**
Oct 03, 2026
In 23 days
Target: 2:05:00
Predicted: ~2:20:09

**Treviso 10K Tiramisu Run**
Oct 11, 2026
In 31 days
Target: 57:30

**Marathon**
Feb 07, 2027
In 150 days
Target: 4:02:39

**Ironman Italy Cervia**
Jun 20, 2027
In 283 days
Target: 11:43:58
Predicted: ~10:54:05

AI Coaching

Over the last 4 weeks, training volume has been low and inconsistent, with sleep chronically short (many nights under 6 hours, several under 5) and body battery frequently depleted — pointing to accumulated fatigue that will cap adaptation. The swim base is the most pressing concern: only three open-water sessions totalling ~4km logged, with average pace around 28:30/100m, well outside the 2:30/100m target for the Half Oceanman 5,000m swim in 25 days. Cycling shows reasonable aerobic base (2+ hour rides at Z2) but running is completely absent from the last 4 weeks, which needs addressing ahead of the Treviso 10K in 33 days.

- Prioritise pool swimming this week and next — with 25 days to the Half Oceanman 5,000m, every pool session matters; hit the planned 2,500–3,000m sessions and focus on holding 2:30/100m pace for extended continuous blocks to build confidence for the race distance.
- Protect sleep aggressively for the next 3 weeks — with body battery routinely peaking below 60 and multiple nights under 5 hours, recovery is compromised; aim for a consistent 7–8 hours before and after key sessions to allow adaptation and arrive at race day with a full battery.
- Reintroduce running this week with the planned Tuesday tempo session but treat it as an aerobic effort (keep HR controlled, 5:50/km end of the range) given zero running load in the last 4 weeks — avoid aggressive intensity until the legs show they can handle consecutive sessions.
- For the Half Oceanman taper week (Wk15), Sunday's 21.5km long run the day after the race is excessive for recovery — this should be replaced with a gentle shakeout or full rest to protect both race performance and post-race recovery.
- The planned Wk13 Saturday ride is already AI-adjusted to 60km/120 min at reduced power, which is appropriate — honour this cap and resist extending it, as arriving at the Half Oceanman with heavy legs from a long ride 13 days prior would directly compromise swim performance.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

DATE	DISCIPLINE	PROPOSED	TYPE
2026-09-08	Running	Easy-to-moderate aerobic run 35–40min @ 5:50–6:10/km, HR cap 145bpm — no true tempo effort	DECREASE
2026-09-13	Running	12–14km @ 6:30–6:45/km, cap at 90–95min — comfortable aerobic effort, flat route, stop if	DECREASE
2026-09-26	Cycling	80–90km @ 128–160W, cap at 180min — include 2×10min @ 178–200W tempo blocks mid-ride to ma	DECREASE
2026-09-27	Running	10–12km @ 6:30–7:00/km, cap at 75min — easy aerobic, no surges, prioritise feel over dista	DECREASE
2026-10-03	Rest	Race day — Half Oceanman 5,000m swim. Full rest otherwise; light warm-up swim only pre-rac	SKIP

2026-10-04	Running	Full rest or optional 20–25min very easy walk/jog @ 7:30+/km — no structured running, focu	DECREASE
