AI Coaching

- The last 4 weeks show critically low training volume — only a single 9-minute open-water swim is logged — almost certainly explained by the illness reported on 15 August. Sleep is consistently poor (most nights under 6 hours, many under 5) and body battery is chronically depleted, confirming the body is still recovering rather than absorbing training stress. With the Half Oceanman 5,000m swim just 35 days away, the immediate priority is rebuilding swim volume carefully and safely before attempting any intensity.
- Prioritise swim volume above all other disciplines this week and next: the Half Oceanman is 35 days away and the 5,000m distance requires at minimum 3 swim sessions per week hitting 2,000–2,500m each — start conservative given the recent illness and ramp weekly.
 - Sleep is the single biggest limiter right now — most nights are under 5.5 hours and body battery rarely exceeds 60; aim for a strict 7–8 hour sleep window to allow any training to actually produce adaptation before the race.
 - Do not attempt the planned 100km long ride today (29 Aug) at full distance; your body battery is at 38–60 and you have had essentially zero training load for 4 weeks — treat this weekend as a reintroduction block, not a training block.
 - For the Half Oceanman swim target of 2:30/100m, include at least one pace-specific set per week (e.g. 6×200m at 2:25–2:30/100m with 30s rest) from week 11 onward to build confidence at race pace before the taper.
 - Hold off on full tempo run intensity (5:35–5:50/km blocks) until at least week 12 given the post-illness return; replace week 11 Thursday tempo with a comfortable aerobic 30–35 min run at 6:15–6:30/km to assess run legs safely.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):
