Race Targets

**Half Oceanman**
Oct 03, 2026
In 63 days
Target: 2:05:00
Predicted: ~2:12:20

**Treviso 10K Tiramisu Run**
Oct 11, 2026
In 71 days
Target: 57:30
Predicted: ~1:01:53

**Marathon**
Feb 07, 2027
In 190 days
Target: 4:02:39
Predicted: ~4:21:08

**Ironman Italy Cervia**
Jun 20, 2027
In 323 days
Target: 11:43:58
Predicted: ~16:59:27

⚠ Pre-Race Conflicts

DATE	DISCIPLINE	SESSION	DURATION	CONFLICT
2026-10-09	Swimming	Wk16 Pool Swim (Friday)	60min	2d before Treviso 10K Tiramisu Run
2026-10-10	Cycling	Wk16 Long Ride	240min	1d before Treviso 10K Tiramisu Run

🤖 AI Coaching

- The last 4 weeks show a very fragmented training pattern dominated by chronic sleep deprivation — the majority of nights fall well below 6 hours, body battery is consistently low (frequently under 30), and the one hard running effort on July 18 at 179 bpm HR signals a red-flag overreach relative to current recovery capacity. The lone long ride on July 20 (77km, 282 min) is encouraging for Ironman base-building, but the absence of any pool swimming and the near-total training silence in the final 10 days of July indicate the body has been forced into involuntary rest rather than planned recovery. With the Half Oceanman (5km swim) just 63 days away and no pool sessions recorded in 4 weeks, the swim discipline is the most urgent priority once sleep stabilises.
- Treat sleep as the primary training variable right now: target a minimum of 6.5 hours per night before resuming any structured running or cycling — without this, absorbing even Z1 work is counterproductive and injury risk is elevated.
 - Begin pool swimming immediately once body battery exceeds 45 on two consecutive mornings; with the Half Oceanman 63 days out requiring a 5km open-water swim at 2:30/100m, pool volume must rise to at least 2 sessions per week of 2,000m+ urgently.
 - Do not attempt the Aug 9 long run (18.8km) or Aug 8 long ride (88km) at the planned volumes unless sleep has averaged 6.5h+ for the preceding 5 nights — cap at 8km walk-run and a 60-min Z1 spin respectively if that gate is not met.
 - The July 18 run at 179 bpm avg HR (vs 150–152 bpm on other runs) suggests either excessive heat, accumulated fatigue, or a pace that is too aggressive — keep all running at HR ≤145 bpm until sleep is consistently above 6 hours for at least 5 consecutive nights.
 - For the Treviso 10K (71 days away), ensure the plan includes 2–3 race-pace intervals (5:40–5:50/km) per week from Week 9 onward, but only after recovery is re-established; do not introduce race-pace work while body battery is routinely below 40.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):
