## Race Targets

**Half Oceanman**  
Oct 03, 2026  
**RACE DAY!**  
Target: 2:05:00  
Predicted: ~2:31:56

**Treviso 10K Tiramisu Run**  
Oct 11, 2026  
In 8 days  
Target: 57:30  
Predicted: ~1:02:32

**Marathon**  
Feb 07, 2027  
In 127 days  
Target: 4:02:39  
Predicted: ~4:23:55

**Ironman Italy Cervia**  
Jun 20, 2027  
In 260 days  
Target: 11:43:58  
Predicted: ~16:34:28

## Last 30 Days

**14**  
SESSIONS

**25h**

**5.5h**  
AVG SLEEP

**50**  
BODY BATTERY

**Swimming (3)**  
**9.2km** TOTAL  
**2:58/100m** PACE

**Running (1)**  
**10km** TOTAL  
**6:15/km** PACE

**Cycling (7)**  
**238km** TOTAL  
**17.6 km/h** SPEED

## AI Coaching

- Over the last 4 weeks training has been heavily swim and bike dominant with only one run logged (10km at 169bpm avg HR, a high-effort effort that signals running fitness is underdeveloped relative to race targets). Sleep is chronically short — the majority of nights fall below 300 minutes, with several dipping below 210 minutes — and body battery scores are consistently low, suggesting accumulated fatigue that could compromise race performance and injury resilience. The Half Oceanman 5km open-water swim is today (Oct 3), so the immediate priority shifts to the Treviso 10K in 8 days, for which the athlete needs a controlled mini-taper starting now.
- Prioritise sleep above all else this week — aim for 7+ hours nightly before the Treviso 10K; chronically short sleep (many nights under 4 hours) is the single biggest recovery limiter visible in the data.
  - For Treviso 10K (Oct 10), target 5:45/km conservatively given only one run in 4 weeks; start controlled and negative-split the back half rather than chasing the target pace from the gun.
  - Reintroduce running progressively after Treviso — the 169bpm avg HR on your only recent 10km run at 6:15/km pace indicates you are currently aerobically deconditioned for running; build gently with 2–3 easy runs per week before resuming intervals.
  - The Tuesday Oct 6 interval session (6×800m at 4:55–5:10/km) falls 4 days after today's 5km open-water race and 4 days before Treviso — this is too intense given both the residual swim fatigue and the pre-race taper window; replace with an easy shakeout.
  - Power data is missing on all outdoor rides — adding a power meter or regularly using the indoor trainer with ERG mode would allow much more precise Z2 compliance and remove the guesswork from your Ironman bike build.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

| DATE       | DISCIPLINE        | PROPOSED                                                                                   | TYPE     |
|------------|-------------------|--------------------------------------------------------------------------------------------|----------|
| 2026-10-06 | Running           | Easy 25–30 min shakeout jog at 6:30–7:00/km, flat, HR under 140bpm — no intervals          | REPLACE  |
| 2026-10-06 | Swimming          | Skip — full rest or 20-min gentle walk only                                                | SKIP     |
| 2026-10-08 | Cycling           | Reduce to 20–25 min very easy spin below 128W (Z1 recovery only), cadence drills, no tempo | DECREASE |
| 2026-10-08 | Strength Training | Skip gym session entirely — substitute 10 min of light mobility and leg swings only        | SKIP     |
| 2026-10-13 | Cycling           | Easy 30–35 min run at 6:30–7:00/km (conversational pace, HR under 145bpm) to begin re-esta | REPLACE  |
| 2026-10-18 | Running           | Cap at 12–13km at 6:30–6:45/km (strictly aerobic, conversational effort, no negative-split | DECREASE |
