Race Targets

Half Oceanman
Oct 03, 2026
In 1 days
Target: 2:05:00
Predicted: ~2:29:55

Treviso 10K Tiramisu Run
Oct 11, 2026
In 9 days
Target: 57:30
Predicted: ~1:02:32

Marathon
Feb 07, 2027
In 128 days
Target: 4:02:39
Predicted: ~4:23:55

Ironman Italy Cervia
Jun 20, 2027
In 261 days
Target: 11:43:58
Predicted: ~16:32:56

AI Coaching

Over the last 4 weeks your training has been heavily cycling-biased with solid aerobic bike volume (multiple rides 60–225 min), but running is critically under-represented — only one run in the entire block, executed at a very high average HR of 169 bpm. Sleep is consistently short (most nights 230–415 min, well below the 7–8 h optimal), body battery remains low-to-moderate throughout, and the two recent days showing battery values of 0–2 are a clear fatigue red flag. With the Half Oceanman 5,000 m swim just 7 days away, the priority is to protect freshness and execute a confident taper, then use the following week to safely absorb the race before the Treviso 10K on Oct 10.

- Sleep is your biggest limiter right now — most nights are under 6 hours and body battery is chronically suppressed; aim for at least 7.5 hours tonight and every night through race week, as no training session can compensate for this level of sleep deficit before a 5 km open-water race.
- Your sole run in 4 weeks was at 169 bpm average (likely near max), so do not attempt any quality running before the Treviso 10K — the shakeout jogs already planned at 7:00+/km and ≤130 bpm are exactly right; stick strictly to those targets and abort if HR climbs.
- For the Half Oceanman 5,000 m swim, your open-water pace has been 28–31 min/km (roughly 2:50–3:10/100 m), which is slower than the 2:30/100 m target — factor a realistic 42–48 min finish for the 5 km and pace the first 1,500 m conservatively to avoid blowing up.
- After the Half Oceanman on Oct 3, take at least 2 full rest days (Oct 4–5) before resuming any structured training — a 5 km open-water race is a significant physiological stress and you need those days to be truly fresh for the Treviso 10K eight days later.
- From Week 17 onward, running intervals at 4:55–5:10/km are aggressive given your current running fitness; consider starting the first session at 5:20–5:30/km and only tightening pace once HR at that effort settles below 160 bpm.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

DATE	DISCIPLINE	PROPOSED	TYPE
2026-09-26	Cycling	Shorten further to 45–50 min easy spin at 120–135 W (pure Z2 floor), flat route, stop imme	DECREASE
2026-09-27	Running	Keep as planned: 25–30 min walk/jog at 7:30–8:00/km, strictly HR ≤125 bpm; if body battery	DECREASE
2026-09-29	Cycling	Cap at 35–40 min at 120–135 W (low Z2 only), no intervals, no tempo; if legs feel flat aft	DECREASE
2026-09-29	Swimming	Reduce to 1,200–1,500 m total: 400 m easy warm-up, 4×100 m at race pace (2:30/100 m) with	DECREASE
2026-10-06	Running	Replace with 35–40 min easy run at 6:30–7:00/km, HR ≤145 bpm, no intervals — this is 3 day	REPLACE

2026-10-08	Strength Training	Skip entirely — full rest day; optional 10 min of gentle static stretching and foam rollin	SKIP
