> No training data or wellness metrics have been recorded over the last 4 weeks, making it impossible to assess current fitness, fatigue, or adherence to the plan. With a marathon 85 days away targeting sub-4h (5:45/km), the upcoming plan's long runs at 6:15–6:45/km are conservatively paced and appropriate as a base, but the lack of any recent activity data means fitness level is unknown. The priority now is to re-establish consistent training and introduce marathon-pace work progressively before the race.

- With the marathon 85 days away, begin incorporating dedicated marathon-pace (5:45/km) segments within your long runs — start with the final 3–5km of each Sunday long run at race pace to build specificity without overloading.
- Since no recent training data is visible, treat the first 1–2 weeks of the upcoming plan as a fitness assessment block — complete sessions as prescribed but monitor effort carefully and don't chase pace targets if they feel unusually hard.
- The Tuesday interval session on 17 Nov (6x800m at 4:55–5:10/km) represents significant intensity with no recent training baseline; consider completing only 4 reps on the first week to gauge current fitness before committing to the full volume.
- Swimming sessions (2km+ at ≤2:30/100m) will serve double duty for the Ironman build, but for the near-term marathon focus, treat them as low-impact active recovery — prioritise run quality over swim volume if fatigue accumulates.
- Start logging sleep and wellness data immediately — with no body battery or sleep data available, you are flying blind on recovery, which is especially risky when ramping up long-run volume toward a marathon.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

DATE	DISCIPLINE	PROPOSED	TYPE
