AI Coaching

- The last 4 weeks have been severely disrupted by illness starting around 2 August, with only 3 training sessions logged (a hard 5K run, a long ride, and a light hike), and wellness data showing chronically depleted body battery (often 0–30) and fragmented sleep throughout. The athlete is still symptomatic as of 15 August and is wisely planning a cautious return week of 17 August. With the Half Oceanman 49 days away (5,000m swim at 2:30/100m), the immediate priority is a safe return to training without relapse, with swim volume being the most critical discipline to rebuild.
- Treat the week of 17–23 August as a true 'return to sport' week — cap all sessions at 30–60 minutes, use HR as the primary governor (stay ≤140 bpm), and skip any session if morning body battery is below 40 or resting HR is elevated.
 - Swim is your highest-priority discipline for the Half Oceanman (5,000m in 49 days); aim to complete at least two pool sessions per week from week of 18 August onwards, even if reduced to 1,500m technique-focused sets initially, to rebuild feel and aerobic base in the water.
 - The week of 24–30 August abroad should be treated as an opportunistic swim-heavy week — pool or open water access abroad is likely, so lean into swim volume while deprioritising long cycling (no access to your bike) and running on unfamiliar terrain.
 - Monitor body battery daily: before resuming any session above 60 minutes or above Z2 effort, you need at least 2 consecutive days with body battery peak ≥55 — the data shows you have not had a sustained recovery window since late July.
 - The Wk9 Sunday long run (18.5km, 180 min on 23 August) is far too aggressive for a first full week back after 3+ weeks of illness; protect your return by capping the weekend long run at 45–60 minutes easy until two solid training weeks are completed.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):
