## Race Targets

**Half Oceanman**  
Oct 03, 2026  
**In 39 days**  
Target: 2:05:00  
Predicted: ~2:13:20

**Treviso 10K Tiramisu Run**  
Oct 11, 2026  
**In 47 days**  
Target: 57:30

**Marathon**  
Feb 07, 2027  
**In 166 days**  
Target: 4:02:39

**Ironman Italy Cervia**  
Jun 20, 2027  
**In 299 days**  
Target: 11:43:58  
Predicted: ~1:41:20

## AI Coaching

- The last 4 weeks show extremely limited training — only a single hiking session logged — combined with severely disrupted sleep (multiple nights under 5 hours, body battery repeatedly at single digits) and a self-reported illness from 15 August onwards. Recovery is finally trending slightly better in the last few days (Aug 16 sleep ~9.8hrs, body battery touching 85), but the athlete is still in a deep fatigue hole with 42 days to the Half Oceanman 5000m swim. The priority now is a careful, graduated return to training — particularly swim volume — without digging the fatigue hole any deeper.
- Treat this weekend (Aug 22–23) as a true recovery gateway: the adjusted 60-min easy ride is appropriate, but the 180-min / 18.5km long run on Sunday is too aggressive for someone returning from illness with body battery still recovering — cap it at 60–75 min easy running and rebuild from there.
  - Swim volume is the single most urgent fitness lever given the Half Oceanman 5000m swim in 42 days — prioritise every pool session in weeks 10–13 and treat the Friday 75-min race-simulation swim (Aug 28) as non-negotiable as noted in the plan.
  - Protect sleep above all else: the data shows a pattern of 3–4 hour nights repeatedly crashing body battery below 15; adding a consistent 'sleep window' target (e.g. 7–8 hrs minimum) will accelerate fitness absorption more than any single training session.
  - Hold back intensity across all three disciplines until body battery is consistently above 50 at start of day — this means keeping cycling at 110–130W and running at 6:15–6:45/km through at least the first half of week 10 before introducing any tempo or Z3 work.
  - With the Treviso 10K Tiramisu Run only 8 days after the Half Oceanman (50 days away), avoid adding any dedicated run-speed work in the final 2 weeks before Oceanman — the race-fitness carry-over and a short taper will be sufficient for a 5:45/km 10K effort.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

| DATE       | DISCIPLINE | PROPOSED                                                                                   | TYPE     |
|------------|------------|--------------------------------------------------------------------------------------------|----------|
| 2026-08-23 | Running    | Easy aerobic run of 60–70 min at 6:30–6:50/km, HR ≤138 bpm. Stop immediately if HR drifts  | DECREASE |
| 2026-08-27 | Cycling    | Shorten to 50–55 min at 110–140W (lower Z2 only); stop if HR exceeds 145 bpm at these watt | DECREASE |
| 2026-08-28 | Swimming   | Retain as the anchor session of the week. Aim for 3,000–3,500m total with 2×750m continuou | REPLACE  |
| 2026-08-29 | Cycling    | Keep as 60 min easy at 110–130W. Skip the AI-added evening open-water swim on this day — d | DECREASE |
| 2026-08-30 | Running    | Cap at 90 min easy at 6:30–6:50/km (approximately 12–13km). Negative-split approach only i | DECREASE |
| 2026-09-05 | Cycling    | Reduce to 150–180 min (approximately 65–75km) at 128–160W; include 2×10 min at 170–177W in | DECREASE |
