AI Coaching

The last 4 weeks have been severely disrupted by illness beginning around 2 August, with only 3 meaningful training sessions recorded and body battery readings collapsing to single digits across much of the period — a clear sign the athlete has been fighting a significant illness. Sleep has been fragmented and often grossly insufficient (multiple nights under 5 hours, one as low as 41 minutes), compounding recovery deficit. With the Half Oceanman 49 days away and the athlete only now attempting a slow return to training from 17 August, the priority is a cautious, graduated re-entry that protects health above all else.

- For the first 5–7 days back (17–22 Aug), keep every session under 30–40 minutes, fully aerobic and conversational — HR should not exceed 140 bpm; treat body battery below 50 as a rest day regardless of the plan.
- Swim volume is your most accessible and lowest-impact discipline right now: prioritise pool sessions over running and cycling during the return week, as technique work and easy aerobic sets carry minimal injury and relapse risk.
- The Half Oceanman (5,000m swim) in 49 days is your nearest race — with 3.5 weeks of illness-enforced downtime, accept that the swim will be a completion effort at ~2:35–2:40/100m rather than target pace, and structure weeks 9–12 around just getting the distance back in the water confidently.
- During the abroad week of 24–30 Aug, anchor training around hotel-pool swims and bodyweight strength — skip any session requiring a road bike or specific equipment, and do not attempt the 100km ride unless a suitable bike is confirmed and body battery is consistently ≥60.
- Reintroduce running intervals and tempo work no earlier than week 10 (25 Aug onwards) and only if two consecutive easy runs have been completed without cardiac drift or lingering symptoms — the Treviso 10K is 57 days away and pace fitness can be recovered quickly once the base is stable.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):
