AI Coaching

- Over the last 4 weeks, training has been inconsistent and fragmented, with only 9 sessions logged across all three disciplines and no clear weekly structure emerging. Sleep is a significant concern — the majority of nights fall well below the 7-hour minimum, with several nights under 4 hours and body battery readings frequently in the low-to-mid range, indicating chronic under-recovery. With the Marathon 120 days away as the priority race, run volume is critically low (only one running session logged at a high HR of 169 bpm for just 10km), and this needs to be addressed carefully given the fatigue picture.
- Prioritise sleep as a performance variable — consistently hitting 7+ hours per night will do more for your marathon preparation over the next 4 months than any single session; consider setting a hard cut-off time for evening activities.
 - Run frequency needs to increase gradually toward marathon prep: aim for 3 runs per week by late October, but keep easy runs truly easy (HR below 145 bpm, ~7:00–7:30/km) given the current fatigue baseline.
 - The Oct 25 5K Open Water Swim race is well-timed as a swim fitness check — taper swim volume slightly in the 2 days prior and treat it as a hard effort, but don't let it compromise the weekend long run recovery cycle heading into marathon build.
 - With no power data on the bike and no structured cycling intervals logged, consider adding at least one session per week with perceived-effort Z2 targets (conversational pace) to build aerobic base for the Ironman bike leg without adding excessive fatigue.
 - The Tuesday Oct 13 triple-session (cycling + swimming + running) is overly ambitious given your current sleep and fatigue levels — consolidate to two disciplines maximum on any single day to avoid accumulated strain.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):
