Race Targets

Half Oceanman
Oct 03, 2026
In 63 days
Target: 2:05:00
Predicted: ~2:07:30

Treviso 10K Tiramisu Run
Oct 11, 2026
In 71 days
Target: 57:30
Predicted: ~1:01:53

Marathon
Feb 07, 2027
In 190 days
Target: 4:02:39
Predicted: ~4:21:08

Ironman Italy Cervia
Jun 20, 2027
In 323 days
Target: 11:43:58
Predicted: ~16:55:47

2026-10-03	Cycling	Wk15 Long Ride	240min	0d before Half Oceanman
2026-10-11	Running	Wk16 Long Run	180min	0d before Treviso 10K Tiramisu Run

🤖 AI Coaching

The last 4 weeks reveal a severely under-recovered athlete: sleep has been chronically short (multiple nights under 5 hours, with a 41-minute night on July 27), body battery has repeatedly bottomed out below 30, and training has been fragmented with no bike sessions, minimal swimming, and only three meaningful run/swim efforts. The July 18 run at 179 bpm average HR signals a high-intensity spike on an already depleted system, which compounds recovery debt ahead of the Half Oceanman in 63 days. The immediate priority must be sleep and recovery restoration before any meaningful training load can be absorbed.

- Prioritise sleep above all else for the next 7–10 days: aim for at least 7 hours per night consistently, as no training adaptation is possible on the current 4–6 hour average — use the Aug 1–4 period as a genuine recovery block.
- Use morning body battery as your primary training gate for August: skip any session where waking body battery is below 45, replacing it with a 20-minute walk or full rest, since the Half Oceanman swim (5,000m) requires consistent aerobic load that only a recovered body can absorb.
- Rebuild swim volume gradually over the next 4 weeks targeting 3 sessions per week — the Half Oceanman 5,000m swim at 2:30/100m is the nearest race and swimming has been almost completely absent; each week add no more than 15–20% total swim distance.
- Cap run intensity at Zone 2 (HR ≤145 bpm) for the remainder of August — the July 18 run at 179 bpm average on poor sleep demonstrates a pattern of overcooking easy runs, which undermines the Treviso 10K prep (5:45/km target) by accumulating unnecessary fatigue.
- Begin a structured 10-day taper for the Half Oceanman from September 23: reduce total swim volume by 40%, keep short race-pace efforts (e.g. 3×400m at 2:25/100m), eliminate hard cycling and running in the final 5 days to arrive fresh for the 5,000m open-water effort.
