Race Targets

Half Oceanman
Oct 03, 2026
In 49 days
Target: 2:05:00

Treviso 10K Tiramisu Run
Oct 11, 2026
In 57 days
Target: 57:30
Predicted: ~50:23

Marathon
Feb 07, 2027
In 176 days
Target: 4:02:39
Predicted: ~3:32:37

Ironman Italy Cervia
Jun 20, 2027
In 309 days
Target: 11:43:58
Predicted: ~14:30:22

AI Coaching

- The last 4 weeks have been severely disrupted by illness from around 2 August, with training effectively halted for approximately 10 days and sleep quality collapsing dramatically (multiple nights under 5 hours, body battery routinely hitting single digits). Only three sessions were logged in the entire window — a hard run on 18 July, a long ride on 20 July, and a leisure hike on 25 July — leaving a significant fitness gap heading into the final build for the Half Oceanman (49 days away). The priority now is a careful, staged return to training, protecting sleep and recovery above all else, before cautiously rebuilding volume across weeks 9–11.
- Treat the week of 15–17 August as a genuine return-from-illness week, not a training week: the Saturday ride should be capped at 35–40 km at 120–140W and the Sunday run replaced with an easy 30–35 min walk/jog — body battery on 15 Aug is recorded at 0, which is a hard stop signal.
 - Enforce a sleep gate for all intensity sessions over the next 10 days: if the previous night's sleep was under 6 hours or body battery on waking is below 45, convert any planned quality session (intervals, tempo, race-pace) to an easy aerobic alternative or full rest.
 - The Half Oceanman (5,000m swim in 49 days) is the nearest race and swim volume in the plan is the weakest link — prioritise getting two pool or open-water sessions per week back in from week 9 onwards, even if that means shortening a ride or run to protect recovery.
 - The week of 24 August abroad: confirm bike access in advance; if no bike is available, the 29 August 100 km ride should automatically become a 75-min open-water or pool swim rather than being skipped entirely, keeping Half Oceanman swim volume on track.
 - Monitor running HR carefully on return — your 18 July 5 km averaged 179 bpm at only 5:02/km pace, suggesting cardiovascular stress or pre-illness fatigue even before the illness began; keep all running in weeks 8–9 truly aerobic (HR cap 145 bpm) before reintroducing any race-pace work.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

DATE	DISCIPLINE	PROPOSED	TYPE
2026-08-15	Cycling	Cut to 30–40 min easy spin at 100–120W, flat route, strict HR cap of 135 bpm — treat as a	DECREASE
2026-08-16	Running	Replace the run entirely with a 30–40 min easy walk or light open-water float/technique sw	REPLACE
2026-08-18	Running	Retain the sleep gate condition strictly (6.5 h avg sleep 15–18 Aug AND body battery ≥ 50	DECREASE
2026-08-22	Cycling	Cap the ride at 60 min / ~35–40 km at 128–150W (lower half of Z2) with no morning swim add	DECREASE
2026-08-29	Cycling	Explicitly plan for the no-bike scenario given the athlete is confirmed abroad 24–30 August	REPLACE
2026-08-29	Swimming	Skip the added evening swim on this date entirely — if the ride is replaced by a single mo	SKIP
