> No training data or wellness metrics have been recorded over the last 4 weeks, making it impossible to assess current fitness, fatigue, or readiness objectively. With a Marathon 92 days away targeting sub-4 hours (~5:45/km), the immediate priority is establishing consistent training execution and capturing data going forward. The upcoming plan is well-structured for the marathon build, but the absence of any logged sessions suggests a potential gap between planned and actual training that needs addressing.

- Ensure your Garmin device is syncing correctly and capturing all sessions — without data, it's impossible to adjust load intelligently or detect overtraining before the marathon.
- With the 10K race on 8 November (tomorrow), treat it as a controlled fitness test rather than an all-out effort; aim for the lower end of the 5:35–5:50/km target and use the result to validate your marathon pace strategy.
- The marathon is 92 days away — your weekly long runs (20–21km) are well-timed, but ensure you are logging all sessions so progression can be tracked and the peak long run (~32–34km) can be safely scheduled 3–4 weeks out.
- Prioritise the Saturday long ride (60km today) at a genuine Z2 effort (128–177W); without recent data, there's a risk of drifting too hard — use a power meter or HR cap to stay disciplined.
- Begin logging sleep and body battery data consistently, as this is the earliest warning system for accumulated fatigue across a heavy swim-bike-run-strength week structure.

Proposed plan changes (review on the website, apply via "Apply to Dashboard"):

DATE	DISCIPLINE	PROPOSED	TYPE
2026-11-08	**Running**	10K Race: start at 5:50/km for the first 3km, build to 5:35/km if feeling strong from 5km	DECREASE
2026-11-15	**Running**	Long Run 18km @ 6:30–6:45/km — keep firmly at the easy end of the pace range the day after	DECREASE
